

## Vision

Controllability to simplify communication between care team and patient

- Large parallel corpora**  
Wikismall: 108K pairs
- Multi-references manually generated**  
ASSET: 10, Turkcorpus: 8, Newsela: 4
- Reference generation follows human style of editing**  
ASSET
- Controllability over simplicity**  
Newsela
- Controllability over transformation type**  
CUT, EditNTS, ACCESS, with explicit paraphrasing

## Textual Transformations in Simplification

Rewrite the complex text into the simple text while retaining the meaning of the actual text.

Involves four kinds of textual transformations: **Deletion**, **Insertion**, **Replacement**, and **Elaborations**

**Expert:** NSCLC is treated with surgery, whereas SCLC usually responds better to chemotherapy and radiotherapy. Worldwide in 2012, lung cancer occurred in 1.8 million people and resulted in 1.6 million deaths.

**Layman:** Non-small cell lung cancer is more commonly treated with surgical removal of the lung tumor, and Small cell lung cancer responds well to chemotherapy and radiotherapy.

## Our Contributions

- MSD + SIMPWIKI (1500 pairs) = Med-EASi
- 1979 expert-simple text pairs
  - 4478 unique UMLS concepts

	Med-EASi
<b>Levenshtein similarity</b>	0.689±0.22
<b>Fraction of added, deleted and kept words</b>	9.347±11.57, 10.574 ± 12.38, 12.792 ± 10.01
<b>Compression ratio</b>	1.025 ± 0.59
<b>Grammatical Acceptability</b>	expert texts: 98.989% layman texts: 98.737%
<b>Kincaid Flesch Grade Level</b>	expert texts (12.47 ± 5.28) layman texts (10.491 ± 4.98)

- Layman crowd-workers recruited from Toloka AI (crowdsourcing platform) and medical experts recruited from Upwork (freelancing platform).

## Multi-Angle Controllable Simplification Model

Controllable Models

- Human interpretable controllability:** a user should be able to indicate the complex contents that must be deleted, replaced, or elaborated.
- End-to-end model for all types of simplification edits.
- Multi-angle training:** Following MACAW (Tafjord and Clark 2021), our approach use **multi-angle training**, where each component of the input and the output is a **slot** and the input-output combination is called an **angle**.
- Model backbone:** Flexible input-output structure of T5 using a combination of infilling and prompting
- Model Versions:** control-free versions (SIM and SIM<sub>ip</sub>) and controllable versions (ctrlSIM and ctrlSIM<sub>ip</sub>)

requested slots/instructions      input slots

**\$replace\$**; **\$simple\$**; **\$expert\$** = Ankles, knees, elbows, and wrists are usually involved. ;

**\$replace\_in\$** = [involved]

output slots

**\$replace\$** = [involved <by> affected] ; **\$simple\$** = Ankles, knees, elbows, and wrists are usually affected.

## Automatic Evaluation

### Evaluation

	models	SARI	ADD	DEL	KEEP	FKGL	ROUGE-1
• ctrlSIM model with angle ERI → RS achieves highest SARI score of 0.49	ctrlSIM	39.63	8.99	70.67	39.2	10.55	0.41
• ctrlSIM <sub>ip</sub> : average SARI score vary by angles	ctrlSIM <sub>ip</sub>	40.2	8.51	70.07	42.04	11.09	0.43

## Human Evaluation

- Fluency: mostly fluent
- Grammaticality: 40% grammatically correct model output
- Output annotation quality
  - 22% of the time model performed what user have asked for
  - Model generated mostly matches the replaced content
  - Elaborated contents are mostly relevant and

Next Step

Improve elaboration using additional contexts (definitions and description of complex medical terms)
